

# Policy Statement 6.18 – Safety of Dental Amalgam

## Position Summary

Dental amalgam should continue to be available for use as a dental restorative material. Dental clinics should practice good mercury hygiene.

## 1. Background

- 1.1. Dental amalgam has been used as a dental restorative material for more than 150 years. It has proved to be a durable, safe and effective material which has been the subject of extensive research over this time.<sup>i</sup>
- 1.2. The FDI World Dental Federation's position on amalgam safety includes the following:
  - Dental amalgam releases very small amounts (nanograms<sup>1</sup>) of mercury, some of which is absorbed by the body;
  - The level of urinary mercury is positively correlated with the number of amalgam restorations, but can also be affected by sources other than amalgam;
  - There is no evidence to support an association between the presence of amalgam restorations and chronic degenerative diseases, kidney disease, autoimmune disease, cognitive function, adverse pregnancy outcomes or any non-specific symptoms;
  - Local hypersensitivity reactions can occur on the mucosa adjacent to amalgam restorations, but are extremely rare and usually resolved on removal of the amalgam;
  - Further research into the possible adverse effects of dental amalgam is desirable; and
  - Alternatives to amalgam may have adverse effects.
- 1.3. The National Health and Medical Research Council has attested to the value and safety of dental amalgam but has suggested that it would be prudent to reduce its use in special populations, including children, women in pregnancy and persons with existing kidney disease.<sup>2</sup>
- 1.4. There is no evidence that replacement of sound amalgam fillings by alternative materials, without clinical indication, produces a better health outcome for patients.

### Definition

- 1.5. DENTAL AMALGAM is a mixture of metals including silver, copper and tin with mercury forming a stable alloy.

## 2. Position

- 2.1. Dental amalgam should continue to be available as a dental restorative material.
- 2.2. Dental amalgam restorations should not be removed and replaced with alternative restorative materials for non-specific or perceived health complaints unless the patient has been fully informed of the

implications of this decision.

- 2.3. Further research into the potential adverse effects of the alternatives to amalgam is desirable
- 2.4. Dentists should minimize the use of dental amalgam in children, pregnant or breastfeeding women and in individuals with kidney disease.
- 2.5. Only capsulated dental amalgam complying with ISO 24234:2015 'Dentistry - Dental amalgam' should be used in dental clinics.
- 2.6. Dental clinics should practice mercury hygiene and correctly dispose of dental amalgam waste.
